

Welcome, enjoy your Natede. Take your time, choose your favorite plant and the perfect place to start a new way of living in harmony with nature.

Natede Basic

Natede Smart

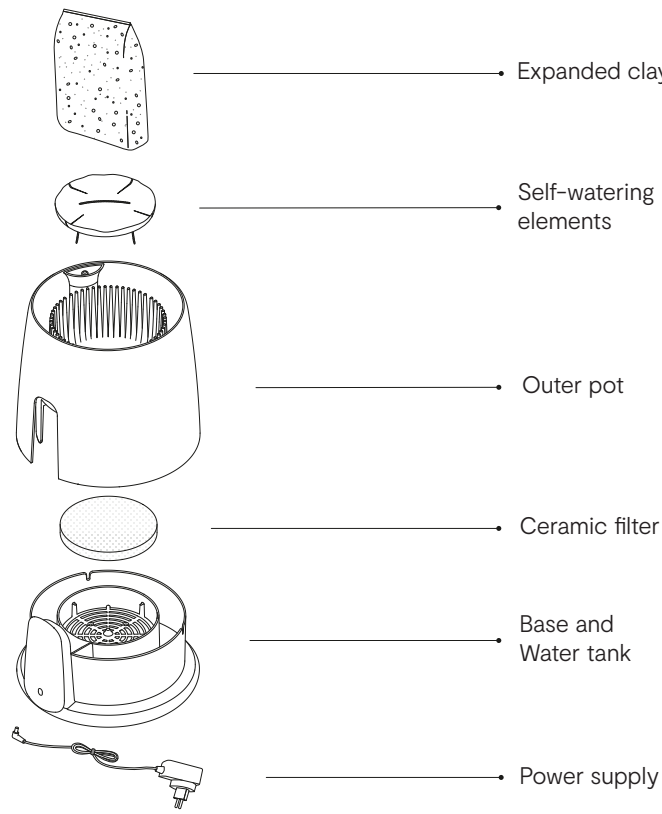

Scan the QR code to access the full guide.
Assembly time: 15 minutes

What's in the box?

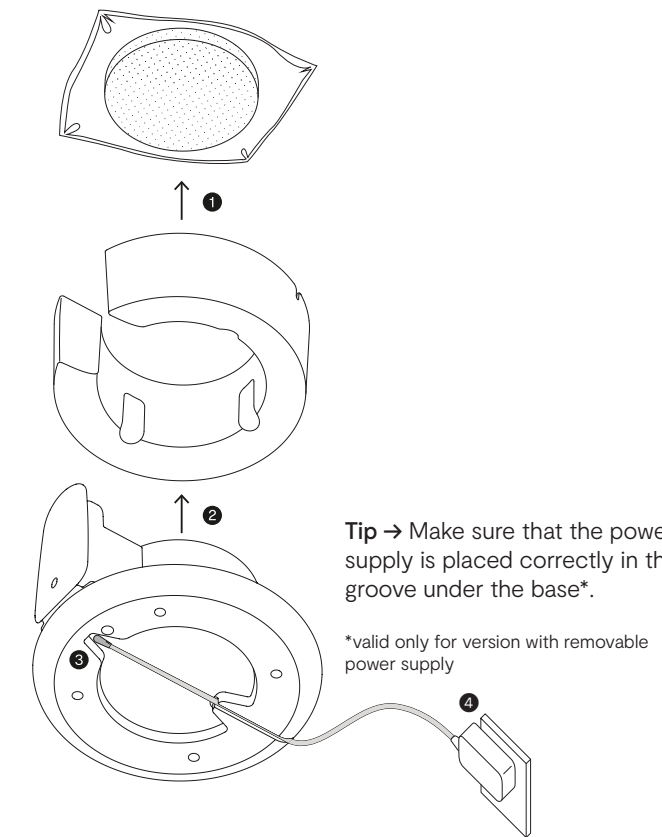

In the box you will find the following components. Otherwise, contact us at support@vitesy.com.

Plant and soil not included.

1 → Plug Natede

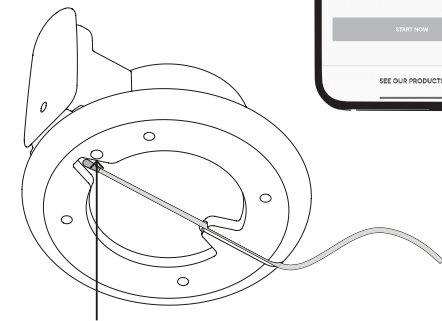

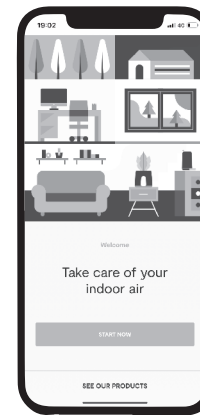

Carefully remove the ceramic filter ① and the water tank ② and connect the power supply to the base ③ and to the socket ④.

→ For **Natede Basic** go to point 2.

→ For **Natede Smart** open the Vitesy Hub app, make sure the bluetooth is turned on and follow the instructions. After successfully connecting the device, go to point 2.

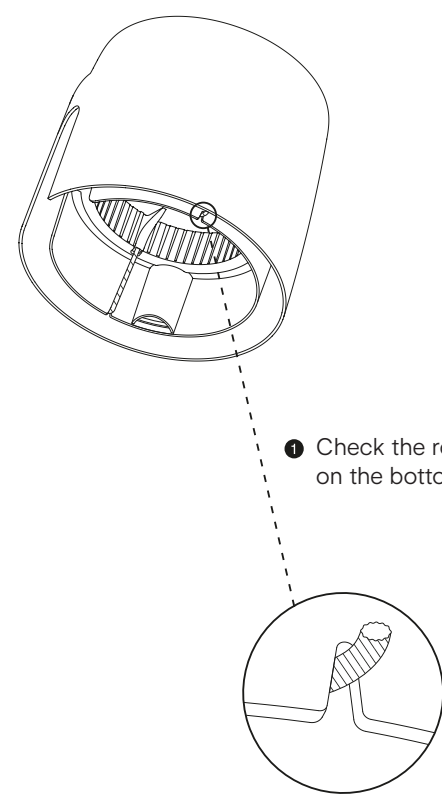

Available on:

Tip → To press the Reset button use a paper clip or a toothpick.

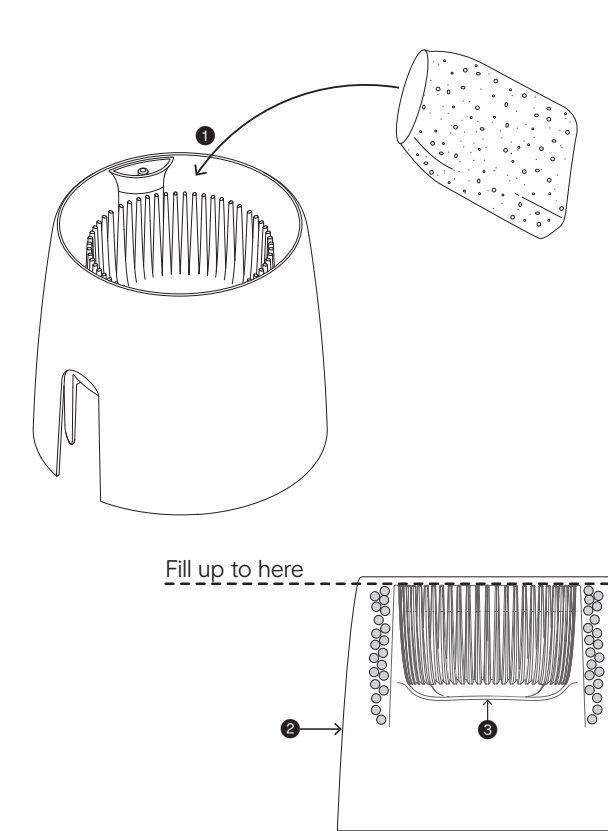

2 → Check the rope

Make sure that the rope is placed correctly in the grooves under the pot ①.

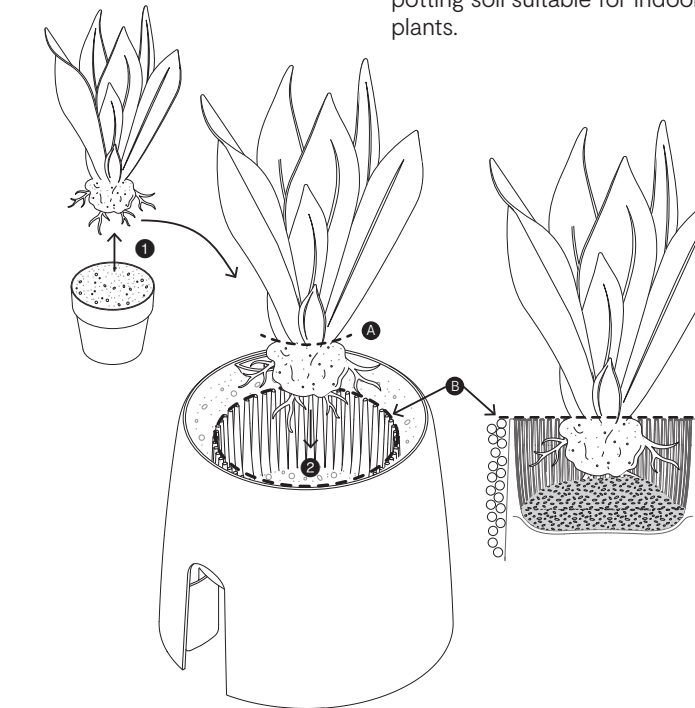

3 → Add the clay

Use the provided expanded clay to fill the empty space ① between the outer pot ② and the inner basket ③ up to the tips.

4 → Re-pot the plant

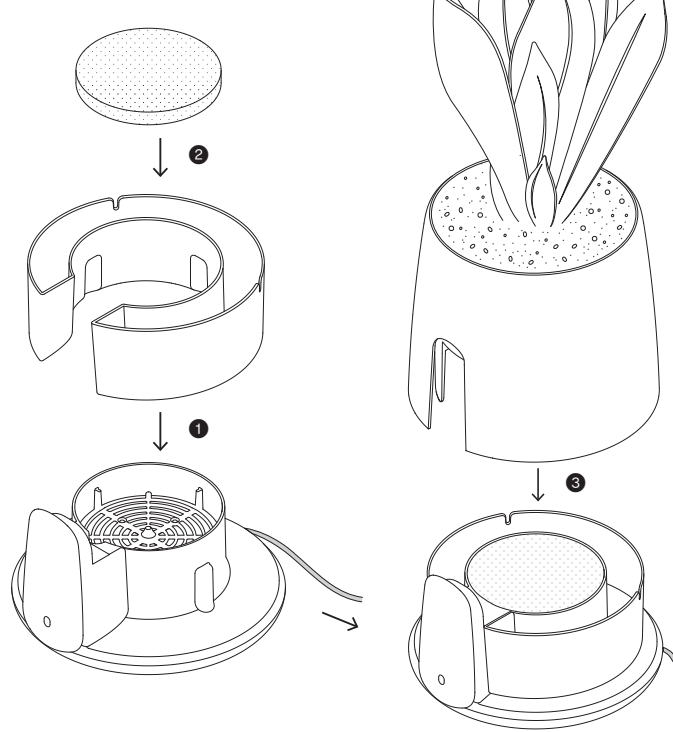

Soil → Use a good quality potting soil suitable for indoor plants.

Use a plant with a pot diameter of 8-10 cm (3-4 in). Take the plant out of its pot and gently disentangle the roots ①. Add the soil to the bottom of the pot ② so that the hatched area ④ is at the same level of the top of the basket ③. Fill the remaining space with soil. Cover the surface with expanded clay.

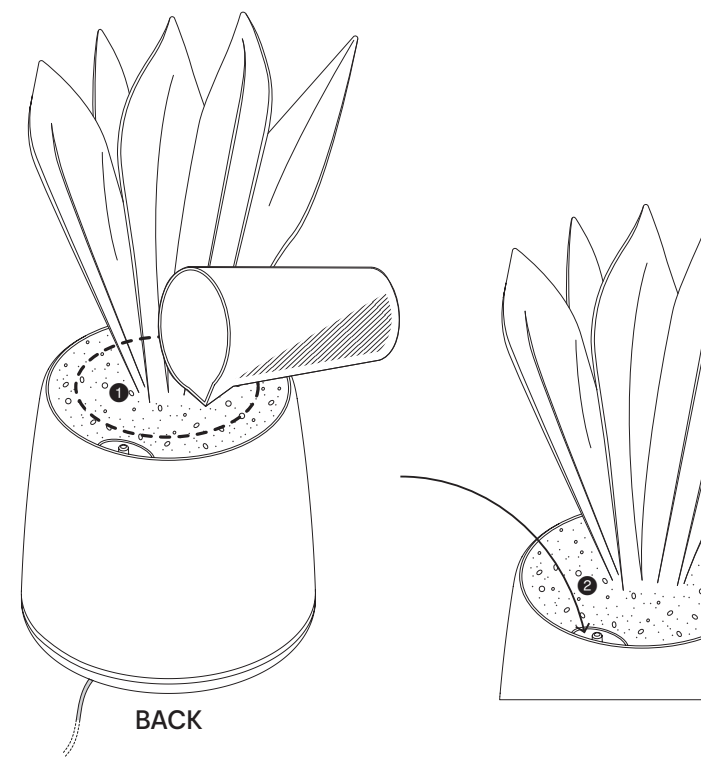

5 → Assemble

Caution → Do not handle the filter with bare hands to avoid making it dirty.

Place the water tank on the base ①. Remove the ceramic filter from its bag and place it over the grid ②. Lastly, place the outer pot on the base as shown ③.

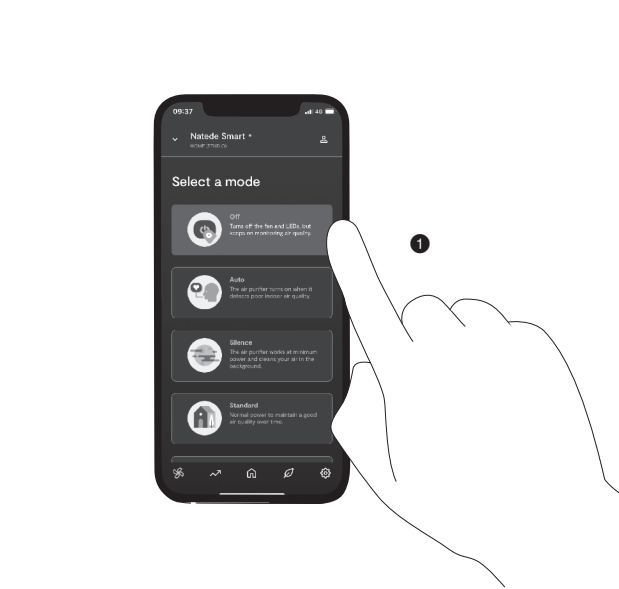

6 → Days 1 and 2

For the first two days water the plant directly from the soil until the soil is damp. Be careful to water the plant inside the inner basket ①. Meanwhile, slowly fill the water tank through the spout ②. Pause every second to allow the float to rise and check the level. When the green line is visible, the tank is half full; when it's yellow it's full. **Make sure not to go over the red line.**

We suggest keeping Natede's fan off for the first 4 days after potting, so that your plant can acclimatise to the soil and grow without stress.

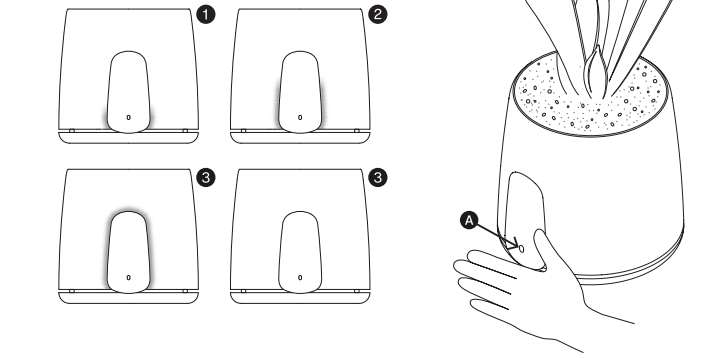

- For **Natede Basic** go to point 8.
- For **Natede Smart** use the app ① or go to point 8.

7 → Day 5

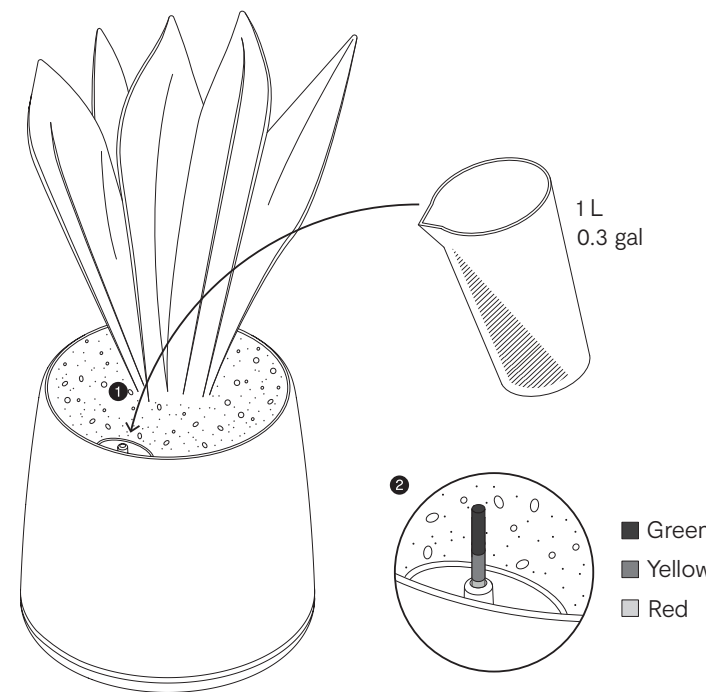

To change the fan mode keep a hand in front of the hole ①. With a double blink of the LEDs, every 1 second the mode changes in this order:

- ① **Silence** (fan at 25% and LEDs off): the lowest band of LEDs lights up as indicated;
- ② **Standard** (fan at 50% and LEDs on): the low and mid-range band of LEDs lights up as indicated;
- ③ **Performance** (fan at 100% and LEDs on): the whole band of LEDs is on as indicated;
- ④ **Off**: fan and LEDs off.

This list of modes goes in cycles so you will always see: *silence - standard - performance - off - silence - standard - ...* Once you remove the hand, the LEDs will blink twice to confirm the selection. If you put your hand in front of the hole ①, the currently selected mode will flash.

8 → Fill the tank

Slowly fill the tank through the spout ①. Allow the float to rise and check the level. When the green line is visible, the tank is half full; when it's yellow it's full. **Make sure not to go over the red line ②.**
